

THE PREVALENCE OF CHRONIC DISEASES FROM HMO RECORDS
ACROSS AGE AND TIME

Poster presented at the annual meeting of the Gerontological Society of America,
San Francisco, CA. November 24, 1991.

Introduction

Among people aged 65 and older, over 85% have some form of chronic illness (Butler & Lewis, 1982). Guralnik and associates (Guralnik, LaCroix, Everett, & Kovar, 1989) have examined common chronic conditions in the elderly and found that 78.8% of those 60 and older reported having had at least one of these conditions. Arthritis was the most prevalent condition reported, with 49% of their older subjects reporting this condition.

The increasing prevalence of comorbidity of chronic conditions has also been reported, using self-report measures. An estimated 48.7% of subjects aged 60 and older have 2 or more chronic conditions, and 22.9% are estimated to have 3 or more (Guralnik et al., 1989).

The purpose of the present study is to: 1) calculate prevalence and incidence rates of chronic diseases utilizing physician records from a Health Maintenance Organization (HMO) and to compare these rates to those previously obtained from self-report questionnaires, 2) examine changes in these rates across age, 3) examine changes in rates of prevalence across time (controlling for age), and to 4) examine changes in HMO utilization patterns across time.

Method

Subjects

This study employs a sample of 845 people from the Seattle Longitudinal Study (SLS, Schaie, 1983). The SLS is a longitudinal-sequential study of cognitive aging with data collection points every seven years. Participants in this sample entered the SLS in 1956, 1963, and 1970 and had medical information available up through 1970, 1977, or 1984. A breakdown of the subjects by sex and measurement points is presented in Table 1. Subjects ranged in age from 22 to 94, a breakdown of the subjects by age and sex is presented in Table 2. All of the participants were community dwelling, and most of the subjects were Caucasian.

Measures

Since the SLS recruits subjects from a HMO, medical records were available for most subjects. Physician records were coded using ICDM-8 diagnostic classifications (USPHS, 1968). Information on the type of diagnoses, number of physician visits and hospital days related to that diagnosis, and number of unique disease occurrences were coded in 7-year intervals comparable to the SLS points of testing (1956, 1963, 1970, 1977, 1984; see Herzog, Schaie, & Gribbin, 1978).

Results

Prevalence of Chronic Diseases

Table 3 presents the prevalence rates of major chronic diseases by 7-year age ranges. Arthritis was the most prevalent chronic disease, followed by vision problems, benign cardiovascular disease (CVD) and neoplasms (particularly benign neoplasms). Rates for all chronic diseases, except neoplasms, were higher for those for people over age 60.

Incidence of Chronic Diseases

Table 4 presents the incidence rates for common diseases across age. The rates are calculated by excluding people who had the disease over the first 7-years of measurement (i.e., rates are calculated from years 7 to 14) Again the highest incidence rates were for arthritis and vision problems. Incidence rates tended to increase with age for all of the diseases.

Comorbidity of Chronic Diseases in the Elderly

Table 5 provides information on the comorbidity of chronic conditions in the total sample, for those people aged 60 and older, and for people under age 60. Of the 12 conditions, only 4.7% of people age 60 or older had no chronic illness, 8% with only one, while 87.3% of the 60 and older sample had 2 or more chronic illnesses ($M = 4.1$ conditions). Rates of comorbidity were lower in the sample under age 60.

Changes in Rates of Chronic Illness Across Time

Table 6 presents information on changes in prevalence rates for the entire sample and for those aged 60-67 over four times of measurement. In the 60-67 age group, increases in prevalence are seen over time, with a dropoff from the 1978-84 period for many conditions. This may be because participants over age 60 in 1984 were recruited to participate in a training study, which may have lead to a selection of healthier subjects.

Changes in Rates of Comorbidity Across Age and Time

Tables 7, 8, and 9 present information on the average number of chronic conditions over a 7-year period broken down by age and time of measurement. The number of chronic conditions increased as a function of age. The 1957-63 period

exhibited the lowest rate of comorbidity when age was controlled for, with an peak rate of comorbidity from 1964-1970.

Number of Physician Visits (HMO Utilization)

Tables 10,11, and 12 present information on the average number of physician visits and hospital days over a 7-year period broken down by age and time of measurement. The number of physician visits and hospital days increased as a function of age and a function of time of measurement, such that older people had more visits and longer hospital stays, and that the number of physician visits and hospital days was highest in most recent times of measurement.

Conclusion

Overall, results suggest that rates obtained from HMO records are comparable to self-report results in national surveys. Prevalence and incidence rates were found to vary across age and period of measurement. The number of physician visits and hospital days over 7-year periods was also found to increase with age and in more recent cohorts.

	1978-84	1886-92	3	6.67	0.58	6-7

^aAverage (midpoint) age at T1 and T2

There are 12 chronic conditions: arthritis, vision problems, benign CVD, neoplasms (excluding skin cancer), miscellaneous CVD, hypertension, atherosclerosis, impaired hearing, cerebrovascular disease, diabetes mellitus, osteoporosis of hip fracture, and depression.

Table 8: Mean Number of Chronic Conditions Across Time of Measurement (Controlling for Age):

Time	Mean ^a
1957-63	1.45
1964-70	3.08
1971-77	2.84
1978-84	2.95

^acalculated for ages 32-39 to 67-74, using unweighted means averaged across the 6 age periods

Table 9: Mean Number of Chronic Conditions Across Age (Controlling for Time of Measurement):

Age	Mean ^a
32-39	1.25
39-46	1.58
46-53	2.05
53-60	2.52
60-67	3.08
67-74	3.45

^acalculated using unweighted means averaged across the 4 measurement periods

**Table 10: Mean Number of Physician Visits and Hospital Days over 7-year Periods
by Age and Time of Measurement**

Age ^a	Year	Cohort	n	Physician Visits			Hospital Days
